Updating Shannon’s Maxim

Jay Jacobs
Target Corporation
Agenda

• My World of Cryptography

• Look back: Updating Shannon

• Why there is a problem: Study

• What now
Q: Does the server authenticate the client (mutual SSL auth)?

A: No. We use standard public/private key for SSL certificate.
Study: World of Cryptography

(informal, almost scientific approximation of values)

Don't Understand: think they do, and don't mind trying

Understand: Pragmatic

Understand: Righteous

Don't Understand: know it

Don't Understand: Petrified
Don’t mind trying...

// obfuscate data.
for (curPos=0; curPos < plainTextLen; curPos++) {
    cipherText[curPos] = plainText[curPos] + *(secretKey+keyIndex++);
    if (keyIndex >= secretKeyLen)
        keyIndex = 0;
}

#define OBFUSCATION_KEY "xyzzy"
Looking back

“It must not be required to be secret, and it must be able to fall into the hands of the enemy without inconvenience.”

-- Auguste Kerkhoffs

“The enemy knows the system.”

-- Claude Shannon
The enemy knows key derivation

“The key seed is used to mathematically select from a set of random numbers, and is used to change those random numbers into new numbers, guaranteed to be unique”
The enemy knows the system,
and the allies do not.
Is this okay?

[Our] software employs multiple encryption algorithms in succession to guarantee that the resulting “Token” can never be decrypted.

The encryption algorithms used include Secure Hash Algorithm-256 (SHA-256).

Once all data elements have been encrypted as described above, the entire file is encrypted using ... a 64-bit private key block cipher.
There is a problem with this website's security certificate.

The security certificate presented by this website was not issued by a trusted certificate authority.

Security certificate problems may indicate an attempt to fool you or intercept any data you send to the server.

- More information
Identify the Design Flaw
2010 UK Security Breach Investigations Report:

Listed “poor server configuration/authentication” as the second most prevalent vulnerability leading to a compromise.

2009 Verizon DBIR:

“error during deployment and routine administration of systems was the leading category of error contributing to data compromise”

Error listed as a contributing factor in 67% of the breaches investigated.
Consumer Cryptography

- There is no basic or easy cryptography
- It’s all about motivation
- KM server vs. KM client motivation
- The need for pragmatic cryptography
Why a new maxim is needed

An empirical study of the rituals performed by the “allies” during installation and maintenance
Typical Process Flow

New Product or Upgrade → Try it → Does it Work?

Done ← Yes
Full Process Flow

New Product or Upgrade

Try it

Guess

Have time or ambition?

Does it Work?

Make Sense?

A Little

Yes

No

Yes

No

Yes

No

Yes

No

Ask for help or RTFM

Done
Full Process Flow: Security

New Product or Upgrade → Try it → Guess

If Guess is No:
- Ask for help or RTFM
- Make Sense?
  - No → Have time or ambition?
  - Yes → It Works → Done
- Not Sure → Is it Secure?
  - Yes → Does it Work?
  - No → A Little

If Guess is Yes:
- Does it Work?
  - Yes → Make Sense?
  - No → Have time or ambition?

If Does it Work is No:
- Have time or ambition?
  - Yes → It Works → Done
  - No → Ask for help or RTFM
Where we go from here

Client User Interface (suggested):

- Key Management Server: 
- Enrollment Token: 

[OK]
Where we go from here

• Removing decisions from clients
  • “How easy is this to screw up?”
  • Making Operational = Secure
• Key Management is first
• KM Metadata is second
  • Self-Describing Data (internal)
  • Metadata packaging (referential)
Summary

The enemy knows the system, and the allies do not.
